## **Quality of Life Scale (HHHHHMM Scale)**

Using a scale of 0 to 10 (0 = Unacceptable, 10 = Excellent), pets can be evaluated for their quality of life.

Score Criterion

1.	<b>Hurt</b> —Is the patient in pain, including distress from difficulty in breathing?	
Ca	n the pet's pain be successfully managed? Is oxygen necessary?	Score:
2.	<b>Hunger</b> —Is the pet eating enough? Does hand-feeding help? Does the pet	
rec	quire a feeding tube?	Score:
3.	<b>Hydration</b> —Is the pet dehydrated? Are subcutaneous fluids once or twice dai	ly
en	ough to resolve the problem? Are they well tolerated?	Score:
4.	Hygiene—The pet should be kept brushed and clean, particularly after	
elii	mination. Does the pet have pressure sores?	Score:
5.	Happiness—Does the pet express joy and interest? Is he responsive to things	
arc	ound him (family, toys, etc)? Is the pet depressed, lonely, anxious, bored, or	
afr	aid? Can the pet's bed be near the kitchen and moved near family activities	
to	minimize isolation?	Score:
6.	<b>Mobility</b> —Can the pet get up without assistance? Does the pet need human	
or	mechanical help (eg, a cart)? Does she feel like going for a walk? Is she having	
sei	zures or stumbling? Note: Some caregivers feel euthanasia is preferable to	
am	putation, yet an animal with limited mobility may still be alert and responsive,	and can have
a g	good quality of life as long as the family is committed to quality care.	Score:
7.	More Good Days than Bad—When bad days outnumber good days, the pet's	
suf	ffering is appreciable and quality of life might be too compromised. When a	
healthy human-animal bond in no longer possible, the caregiver must be made		
aware that the end is near.		

Total: A total of > 35 points is acceptable quality of life for pets.
